

Less energy consumed – equally efficient products

Imagine a city with about 150,000 inhabitants supplied with power for a month. This is how much we saved in our production of compressors in 2010*.

All the Embraco plants exceeded their goals – defined according to global sustainability strategy – which represented a 9.1% reduction in energy consumption per compressor produced. According to the Corporate Asset Manager, Fabio Rocha, some initiatives have made a difference, such as investments in more efficient equipment and a large awareness program, involving production teams and various groups of Quality Control Circles.

* Based on the world consumption of the WRI, 2005.
